

FCC:

Concerning the 60 meter band for amateur use, I feel that the frequencies between 5250 and 5400 would be very beneficial for amateur radio use.

From reading the article concerning the use of the 60 meter band, I feel it would be very helpful in domestic communications where our 75 meter and 40 meter band allocations wouldn't work, however, I don't feel limiting those frequencies for only domestic use is needed.

Propagation limitations of that frequency will probably take care of the international QSO concerns that the FCC may have.

Thank You

Brian Sarkisian, KG8CO
